DETAILED ACTION

Drawings

The drawings were received on 2/23/2009. These drawings are accepted.

Allowable Subject Matter

Claims 1-13 are allowed. The following is an examiner's statement of reasons for allowance: the prior art does not teach a method or apparatus in which a first subassembly of cells in a fuel cell stack is supplied with reformates while a second subassembly of cells is not supplied with reformates. The prior art also does not teach that the first and second assemblies of fuel cells are optimized for operation with a cold and hot reformer, respectively, And that the second subassembly is only supplied when the cells are at an appropriate operating temperature.

Tillmetz teaches a fuel cell system with multiple fuel cell stacks that are optimized to work in different temperature ranges; however, Tillmetz discloses that the first fuel cell stack uses unreformed fuel to start-up when cold instead of a fuel cell optimized to run with reformates rich in carbon dioxide and lean in hydrogen (the applicant's definition of a "cold reformer").

Boudjemaa teaches a device and method for supplying hydrogen to a fuel cell which includes a main fuel cell and an auxiliary fuel cell in which the auxiliary fuel cell receives the reformates from the reformer, including carbon monoxide from which chemical energy is converted to electrical energy. The main fuel cell receives purified reformates and operates using hydrogen and carbon monoxide, the latter of which does not exceed a concentration of 100 ppm. While the two auxiliary and main fuel cells are optimized to work using reformates with different concentrations of hydrogen and oxygen, Boudjemaa fails to teach only using the

auxiliary main fuel cell while the reformer is still cold. Boudjemma also fails to teach operating the main fuel cell at a specific temperature threshold of the reformer.
